

## SECURING BUSINESS INTERESTS

CUSTOMER: Leading Global Petroleum Company

CHALLENGE: Secure an exposed supertanker dock with unrestricted recreational water access

RISKS: Loss of profit, terrorist threats, environmental damage

### SITUATION

This global petroleum supplier needed to secure an exposed dock with unimpeded shoreline and water access. This exposed location also has rugged environmental conditions, and very rough weather, making it particularly difficult to detect potential threats while screening out normal environmental occurrences. Additionally, the company sought to better avoid potential pollution incidents.

### SOLUTION

The out-of-the-box robust capabilities of ObjectVideo VEW were implemented to oversee the access bridge, supply pipelines, the dock itself, and the surrounding open water, enabling this customer to better identify potential threats or incidents.

### BENEFITS

Because each fuel tanker shipment represents more than \$1 million in company profit, a need for proactive, real-time security at this vulnerable location was unmistakable. This customer chose to protect their operations by expanding their ability to identify and act on anomalies, safety concerns, or threats that could harm their business. Unlike any other product available, ObjectVideo VEW overcomes the difficult waterside and weather conditions such as white caps, reflections, and tide movement without creating false alarms that are costly and time consuming. As a result, the customer gained real-time capability to protect its profit and operations, as well as address potentially adverse events that could lead to environmental damage.

ObjectVideo® VEW® provides a global petroleum provider with environmentally robust intelligence to help prevent costly incidents.
